

A skier triggered this avalanche on Saturday (2/3). It was a wind slab about 18" deep, 150' wide and ran about 300-400 vertical feet. From e-mail: "Strange thing is that was only about a 25 degree slope, possibly 28 near the crown. One friend was caught in the slide and rode down the path on some of the blocks. Said it was so slow moving it crept down the hill." Photo: Anonymous
