

Skiers in the Bridgers saw multiple large natural avalanches in the Bridgers that had released during recent snow and wind loading. From the email: "Looks like things really went off in the Bridgers in the last few days. Loads of natural avalanche activity, much of it appearing to fail on deeper layers than the new/old interface." This avalanche in the Hourglass was triggered by a large chunk of cornice that broke off. Photo: B. VandenBos

Advisory Region
Bridger Range
Longitude

-110.94W

Latitude

45.83N
