Activity

Snowboarding

I toured up the area above Hebgen lake today

Snow depth was a bit thin down low but quickly increased

The new snow was not bonding well to the old snow surface

While skinning up hill or small pillows the new snow would fracture and slide down hill

I stuck to the area directly to the north shortly after you enter the trees off the lake

I dug a pit below the ridge but did not top out due to the conditions

I kept to low 30 deg terrain and avoided roll overs

My snow pit results are as follows

I dug a pit around 8600'

120cm snow depth

Failed at ground on facets

Ectp 10

Overall there is weak snow on the ground with a pretty dense slab sitting on top of it

Attached are photos of the failure layer and the fracturing of the new snow

Region

Lionhead Range

Location (from list)

Hebgen Lake
