Activity

Snowmobiling

Snow was well below average for this time of year in the Gravelly Range. The snow pit was dug in Wolverine Basin near Standard Creek. A crust has formed on the very top of the snowpack which could be a layer of concerns during the next loading event. I did not have a crystal card on me but advanced faceting was occurring in the snowpack below 60 cm. There is a weak layer at 60cm that failed with the results as follows: CT 23 and ECTN 21.

Region

Dillon Area

Location (from list)

Gravelly Range

Observer Name

Chris Hericks
