

Beehive

Date

Wed, 02/16/2022 - 16:10

Out in Beehive today with AAI Pro 1. No signs of instability aside from very small Loose Dry on SW aspect steep terrain at 9k. Got a decent look up valley and did not see any natural avalanches. Between 3 groups we dug over 20 pits on E and W aspects 9000-9200 ft, with propagation on facets buried 60 cm down in only 2 tests. New snow is right side up, low density, and skis very well anywhere that did not develop a stout crust Sat-Mon. No wind slabs in this location, suspect them to be present higher up but no first hand obs.
