

Solid Snowpack in Hyalite

Date

Sun, 12/01/2024 - 11:40

Activity

Skiing

My partner and I dug a pit on the SW side of Divide Peak at 9200' and conducted an ECT test with a score of ETCN. Our snow pit was about 120cm deep, and the identifiable weak layer in the shovel shear test was an ice crust layer at about 30cm from the base. We did not find any of the faceting issues that have been reported across the advisory range.

Thanks for all that you do!

Region

Northern Gallatin

Location (from list)

Divide Peak

Observer Name

Colten Crowe
